Congratulations!

You have decided to purchase a tried-and-tested TYROLIT Hydrostress unit and have thus acquired a highly sophisticated and reliable state-of-the-art device. Only genuine TYROLIT Hydrostress replacement parts can guarantee quality and interchangeability. If maintenance work is neglected or carried out inexpertly, we will be unable to honour our warranty obligations. All repairs must be carried out by trained personnel only.

Our after-sales service is available to help ensure that your TYROLIT Hydrostress units remain in perfect working order.

We hope that working with your TYROLIT unit will be a satisfying and fault-free experience.

TYROLIT Hydrostress

1 Safety

DANGER
Failure to comply with the safety instructions in the “Safety Manuals / System Manuals” may result in serious injury or even death.
- Make sure the “Safety Manuals / System Descriptions” for the relevant type of saw have been read and understood in full.

DANGER
Death or serious injury can be caused by sudden start-up of the machine!
- Before switching on the system, ensure that no other persons are present in the danger areas.
- Switch the system off before connecting or disconnecting cables.
- When leaving the system unattended: switch off and secure the system to prevent it being switched on again.

Death or serious injury as a result of the sawing machine continuing to run after an accident
- Ensure that the EMERGENCY STOP button can be reached quickly.

Electric shock from live cables and connectors!
- Switch off the WSE1621 Control unit before connecting or disconnecting cables.
- Ensure the power supply is earthed and fitted with an AC/DC sensitive residual current circuit breaker (FI type B) with a maximum residual current of 30mA.

Risk of fire due to incorrect mains voltage!
- Make sure the mains voltage and mains frequency correspond with the mains settings of the WSE1621 Control unit.
1.1 What to do in an emergency

Press the EMERGENCY STOP button on the remote controller.

If the EMERGENCY STOP function is activated on the radio remote controller, the power supply of the main motor is interrupted.

In the event of an emergency, the machine systems can also be switched off via the main switch on the WSE1617 control unit.
2 Description

2.1 System

The WSE1621 Control unit / Remote controller can be used to operate various TYROLIT machine systems.

2.2.3 Accessories for remote controller

The battery charger is exclusively designed for recharging the original interchangeable rechargeable batteries. The battery holder and the cable insert must not be inserted.

Accessories

1 2x interchangeable rechargeable batteries No. 10999383
2 Rechargeable battery charger No. 10984305
3 Rechargeable battery charger with 10–30 VDC connection No. 10984840
4 Remote controller cable No. 10999372
5 Battery holder No. 10999384
6 Key No. 10984309
2.3 Remote controller

The remote controller can be replaced by an accumulator or a battery operated radio remote controller. The remote controller can also be operated using a cable.

2.3.1 Operating modes

Radio remote controller
The transmitter and receiver are a pair of matched units. They cannot be used with other devices. The number on the back of the remote controller must match the serial number on the machine name plate.

Rechargeable battery operation:
The interchangeable rechargeable battery is inserted in the base of the casing of the remote controller. The operating period with a fully charged battery is approximately 12 hours. The maximum reception distance is 25 m.

Ordinary battery operation:
The battery insert included in the scope of supply allows operation with three 1.5 V AA batteries. The reception distance is 25 m and the maximum operating time is 1 hour.

Cable operation:
The cable insert is included in the scope of supply and allows connection of the remote controller to the WSE1621 Control unit. The cable length is 10 m. Cable operation makes it possible to work in areas where radio operation is not allowed (e.g. hospitals). When working with the cable connection, all control signals are transmitted via the electric cable. The rechargeable/ordinary battery holders must not be inserted in the base of the casing during cable operation.
2.4 Connections

2.4.1 Establishing connections for the control unit

- The control unit is isolated from the power supply
- The connectors and couplings are clean
- Cables and hoses are undamaged

Control unit connections

- Cutting tool drive motor
- Feed motor
- Water
- Mains supply
- Cable connection for remote controller
- USB port
2.4.2 Connecting the power and water supply

Connecting motors

- The power supply is earthen and fitted with a residual current operated protective device (F; max. residual current 30mA)
- Sufficient cable cross-sections: up to 25 m long 5 x 4 mm², more than 25 m long 5 x 6 mm²
- Connectors are clean
- Cables are undamaged
Connecting the water supply

Water connections

The WSE1621 Control unit is cooled by water. The control unit must also be cooled during dry applications. The incoming water is routed through the water filter via the control unit and on to the machine system. After cooling the main motor of the machine system during a dry application, the water is drained via a water hose.

Control unit connections

A Wet applications
B Dry applications

- 16 A mains power supply / G16 A generator
- 32 A mains power supply / G32 A generator

### 7 Time field

... h 00:00h time field

---

The machine system is detected automatically during the startup process.

The WSE1621 Control unit is preset for a 32 A mains power supply. (32A appears on the display). It is possible to switch to a 16 A mains power supply. The control unit will automatically return to the 32 A setting when it is restarted.

The WSE1621 Control unit will switch off if it is not used for 30 seconds. The control unit can be reactivated by pressing the pulse button (12).
3.2.4 Power display during operation

The current power range is displayed with a coloured bar and a power value (digit adjusts continuously).
Ideal scenario: In the second orange segments (in iron in the third red segments).

![Power display diagram]

### 3.3 Positioning the WSE1621 Control unit

**CAUTION**
The WSE1621 Control unit can be damaged if it slips or topples over!

- Make sure the WSE1621 Control unit is level and located on a firm surface (grip at the top).

The WSE1621 Control unit should only be switched on when level and upright.

**CAUTION**
Risk of water damage to the WSE1621 Control unit.

- Make sure the WSE1621 Control unit is not positioned in water and that it is located at a safe distance to any splash water.
3.4 Starting the WSE1621 Control unit

- The WSE1621 Control unit is connected to the mains and the water supply.
- The machine system is connected to the WSE1621 Control unit.
  (See “Operating instructions - Sawing system”)
- The remote controller EMERGENCY STOP (11) has been deactivated.

Starting the control unit

► Move the operating elements listed below on the remote controller to their 0 position.

Feed motor potentiometer (6)
Main motor potentiometer (8)
Main motor On/Off (9)
Water switch (10)
Feed joystick, automatically takes up 0 position (12)
Start switch (14)

► Switch on the WSE1621 Control unit by using the main switch (22).
► Switch on the radio remote controller using the start switch (14).

- Indicator lights (radio and battery) initially light up red
- An audible signal is emitted simultaneously
- The TYROLIT logo (A) appears in the display
- The P2 logo and firmware version e.g. r554 appear in the display (B)
- “EMERGENCY STOP information” screen appears in the display (C)
- The indicator light flashes green
If only the remote controller is switched on, the P2 screen will remain on the display.

Application: Check display of software version e.g. r554

- Press the blue reset button (16) on the radio remote controller.
  - The operating screen (D) appears on the display
  - If an error message (E) appears, press the blue reset button (16) again.

- Press the green pulse switch (13)
  - The system indicator on the display lights up.
  - The feed and main motors are released from this point onwards.
  - The control unit automatically detects which machine system is connected.

- Open the water valve on the system supply line.
  - The water valve is displayed on the screen

- Press the Water On/Off switch (10) on the remote controller to I.
  - Water emerges at the cutting tool.

- Press the main motor On/Off switch (9) on the remote controller to position I.
  - The electric motor starts when the main motor potentiometer is in the max. position.

- The WSE1621 Control unit has started up and is ready for operation.

3.4.1 Changing the frequency of the remote controller

The radio remote controller systems are equipped with a frequency generator for selecting a frequency.

If the systems experience a malfunction or radio communication is interrupted (external transmitter, range, rechargeable battery empty), the systems immediately revert to the EMERGENCY STOP state.

**New frequency search:**

The next frequency is selected by switching the start switch on the remote controller off and then on again.

The process of switching off and on is limited to four attempts (channels). If the system does not locate a suitable frequency after four attempts, a changeover to cable operation is necessary.
### 3.5 Selecting the machine system

The machine system is detected automatically during the startup process.

#### Detecting the machine system

1. Wall sawing system
2. Wire sawing system
3. Core drilling system
4. Hand saw

- Cutting tool drive motor
- Feed motor
- Water

### 3.6 Selecting the mains power supply

The WSE1621 Control unit is preset for a 32 A mains power supply. (32A appears on the display). The mains power supply can be switched to a 16 A setting or an emergency power supply mode (G32A / G16A). The control unit will automatically return to the 32 A setting when it is restarted.

To switch the control unit to the 16 A setting or emergency power supply mode (G32A / G16A), perform the startup procedure as far as the point designated “Press the black locking button (2) on the radio remote controller”.

Instead of using the pulse button (13), you can now use the locking button (2) to switch to the 16 A mains power supply or the emergency power supply mode (G32A / G16A). (16A or emergency power supply (G32A / G16A) appears on the display.)
3.7 Tool soft start

The WSE1621 Control unit offers a tool soft start option. The soft start option is particularly applicable in the case of diamond wire saws.

Selecting the tool station

Proceed as follows:

- Start the WSE1621 Control unit.
- Turn the main motor potentiometer (8) to the 0 position.
- Press the Water On/Off switch (10) on the remote controller to I.
- Press the main motor switch (9) to I.
- Slowly turn the main motor potentiometer (8) to 100% power.
### 3.8 Selecting the tool station

The machine systems (wall saws, wire saws, core drilling) are detected automatically during the startup process. When the 1621 control unit has been started correctly, the tool stations can be selected before switching on the main motor.

#### A selection can be made between the following cutting tools:

</tr>
</tbody>
</table>

Proceed as follows:

- Press the tool selection button (5). Toggle between the individual dimensions and speed ratings by repeatedly pressing the tool selection button.

To switch to the high-speed diamond tool:

- To activate the change, press the tool selection button (5) for 3 seconds. When the button is released, the displayed symbol will change.
- Pressing the tool selection button (5) for 3 seconds again and then releasing it will result in the WSE1621 Control unit reverting back to the standard tools.
3.9 Power control

The main motor and the feed motor power are controlled via the potentiometers.

Power control
A Power display for the main motor (the digit value for current consumption adapts continuously)
B Power display for the feed motor (the digit value for current consumption adapts continuously)
6 Feed motor potentiometer
7 Main motor potentiometer

3.10 Adjusting the feed

The feed movements are selected with the joystick (12) and the speed is regulated via the potentiometer (6).

Adjusting the feed

The feed speed is automatically assisted by a feed facility during the cutting process.
3.10.1 Manually adjusting the feed speed

Feed speed

✔ The WSE1621 Control unit has been started

► Select the required feed speed via the feed potentiometer (6).

3.10.2 Locking the feed

So that the joystick does not have to be held in position during the travel feed motion, the travel feed can be locked.

Proceed as follows:

► Push the joystick in the desired direction of travel and, at the same time, press the locking button (2).
► When the joystick and the locking button (2) are released, the feed is locked.

In order to release the feed lock, move the joystick slightly in any desired direction or press the locking button.
3.11 Changing the direction of rotation of the main motor

This function is only possible for wall sawing applications. The direction of rotation can only be changed before starting the main motor.

Proceed as follows:

- Press the universal rotary knob/push button (3).
  - The current direction of rotation of the main motor is indicated on the display.
- Turn the universal rotary knob/push button (3) until the direction of rotation changes on the display.
- Press the universal rotary knob/push button (3).
  - The direction of rotation has been changed and the operating screen is displayed.

When the WSE1621 Control unit is restarted, the direction of rotation of the main motor reverts to the default setting.
3.12 Daily hour counter / stopwatch

The WSE1621 Control unit is equipped with a daily hour counter and a stopwatch. The daily hour counter and the stopwatch can be used during operation as and when required.

### Using the daily hour counter / stopwatch

Proceed as follows:

- Press the Menu selection button (4). The clock screen appears.
- You can alternate between the stopwatch and the daily hour counter by turning the universal rotary knob/push button (3).

When the time measurement is active, it is indicated by an asterisk (C).

The stopwatch can be started, stopped and reset to 0 by pressing the universal rotary knob/push button (3). The stopwatch is set to 0 when the control unit is switched off.

The daily hour counter is operated in the same way as the stopwatch. The daily hour counter remains active until it is reset manually (by repeatedly pressing the universal rotary knob/push button (3)).

To revert back to the operating screen, press the Menu selection button (4).
3.13 Switching off the WSE1621 Control unit

Proceed as follows:

▶ Switch off the electric motor, switch (9) Main motor On/Off.
▶ Deactivate the cooling water, switch (10) Water On/Off.
▶ Close the water valve on the WSE1621 Control unit.
▶ Turn the start switch (14) on the remote controller to the 0 position.
▶ Switch off the WSE1621 Control unit by using the main switch (22).

**CAUTION**

Risk of frost damage to the WSE1621 Control unit!

▶ If there is a risk of frost, blow out any water

Only use the EMERGENCY STOP function in an emergency to stop the WSE1621 Wall saw.
### 3.14 Deactivating the EMERGENCY STOP function

If the EMERGENCY STOP function is activated on the radio remote controller, the radio and battery light (A) will flicker.

The following controls must be moved to the 0 position:

- Feed potentiometer (6)
- Turn the EMERGENCY STOP button (11) clockwise
  - The EMERGENCY STOP screen appears on the display
- Main motor On/Off (9)

Proceed as follows:

- Press the blue reset button (16).
  - The operating screen appears.
- To continue operation, press the green pulse button (13).
4 Servicing and maintenance

4.1 High-pressure cleaning

Caution

Cleaning using high-pressure cleaning equipment is not permitted. The WSE1621 Wall saw could be damaged if it is cleaned with high-pressure cleaning equipment. Products containing cleaning agent can damage parts of the WSE1621 Wall saw, the remote controller and the cables.

High-pressure cleaner
4.2 Cleaning the water filter

✔ Tool

- Pliers
- Fork wrench Size 32

Cleaning the water filter

4.3 Blowing out water

✔ The main switch is set to **OFF**

- Disconnect the mains plug.
- Disconnect all water lines.
- Connect a purge pump to the water coupling.
- Blow out water until all of the cooling water has been removed.
- Remove the pump.

Blowing out water

To ensure the water can be blown out of the lines properly, use the TYROLIT purge pump, no.10998115.
4.4 Rechargeable batteries

3.10.2 Handling and use of rechargeable batteries

- Keep batteries away from high temperatures, direct sunlight and fire.
- Batteries must not be disassembled, crushed, heated above 80°C or burnt.
- Damaged batteries must not be charged or reused.
- If the battery is too hot to touch, it may be defective. Place the product at a sufficient distance to combustible materials in a non-flammable location, where it can be observed, and allow it to cool. Contact TYROLIT customer service when the battery has cooled down.

4.5 Recycling waste

TYROLIT Hydrostress power tools are manufactured using a high proportion of recyclable materials. A prerequisite for recycling is proper material separation. In many countries, TYROLIT is already prepared for taking back your used equipment for recycling. Contact TYROLIT customer service or your sales adviser.
